Function

A method to do some change by event.

~ Regarys

Traditional Function

◈ This a traditional function that people used to use back then, yeah yet.. Still they use it cuz its simple and so fun

◈ Something like :

```
//Traditional Function
function helloButton () {
  setHelloContainer('I got clicked')
}
```

◈ Don't forget the variable :

```
const [helloContainer, setHelloContainer] = useState('Wating ... ');
```

◈ Try To Print this into H1, H2, H3, P or anything you like !...

◈ Oh yeah you need the trigger right? Think about Button onClick..

Arrow Function

◈ Same utility, but this will be useful using this.something.. We will learn it next time..

```
//arrow Function-
const helloArrowFunction = () ⇒{
  setHelloArrow('Arrow Function !! ')
}
```

Again the variable :

```
const [helloArrow, setHelloArrow] = useState('Arrow Hello');
```

◈ Print it using a trigger..

React JSX Function

◈ Simple and its just one line..

```
<button onClick={() ⇒ {setInsideHello('clicked.. inside')}}>Magic i am one.. : {insideHello}</button>
```
